Abstract:

Polymorphous low grade Adenocarcinoma (PLGA) is a malignant epithelial tumour that is essentially limited in occurrence to minor salivary gland sites. It has a unique clinical, histomorphologic and behavioural aspects. It is mainly reported as a painless swelling of the hard and soft palate along with symptoms of bleeding, telangiectasia or ulceration of the overlying mucosa occasionally. In this paper, we present a case of Polymorphous low grade Adenocarcinoma with its clinicopathological features and immunohistochemistry.

Keywords: Lobular carcinoma, Adenocarcinoma, reserve cells.
